# **Laser Standard Operating Procedure**

#### The University of Connecticut Laser Safety Program

#### NOTICE: If entering data in MS Word format do not change form content

#### 1. LASER DATA:

Type: Excimer Wavelength(s): 308nm, 193nm Classification: IV

Manufacturer: Lambda Physik Model: EMG 101 MSC Serial #: 8505E1561

Location Building: BSP Room: G39A UConn Laser #: Z84228

Beam Diameter: Hor. 22mm, Vert. 6-10mm Beam Divergence:

( $\sqrt{}$ ) Pulsed:

Q-Switched: No Max. Energy per pulse: 500 mJ

Pulse Duration: 4-90ns Repetition Rate: 50 Hz MAX

( ) Continuous Wave:

Max. Power:

2. LASER SAFETY CONTACTS: Emergencies: 911

Primary Laser Researcher (PLR): Dr. Richard T. Jones Department: Physics

Campus Phone: 6-3512 Alternative Phone: 6-5081

Department of Environmental Health & Safety Laser Safety Officer (LSO): Martin C. Grahan

Campus Phone: 860-486-3613

Notify the Laboratory PLR and University LSO of all laser-related injuries.

#### 3. LASER SAFETY PROGRAM:

Reference the University of Connecticut Laser Safety Manual for the following:

- Responsibilities of the Laser Safety Committee, Laser Safety Officer, Primary Laser Researcher (PLR), and Laser Users.
- Training requirements.
- Class 3b and Class 4 laser registration and disposal/transfer requirements.
- Medical screening (eye examination).
- Personal Protective Equipment (PPE), including protective eyewear.
- Standard Operating Procedures (SOPs).
- Signage and labeling requirements.
- Non-radiation hazards.

#### **4.** LASER APPLICATION SUMMARY (complete a short summary of intended laser use):

Our experimental nuclear physics group at the University of Connecticut is constructing a scintillating fiber hodoscope to instrument the focal plane of a high-energy photon tagging spectrometer. The tagger is used to monochromate a 12 GeV photon beam that has passed through a 20 micron thick diamond wafer. It is our intention to use the Lambda Physik EMG 101 MSC Excimer laser to thin the diamond to said thickness by means of laser ablation. The sample is mounted in a computer-controlled *XY* translation stage which holds the diamond in a precise position with respect to the beam. The laser produces a beam of 192 nm light (excimer ArF source) which is focused using a fused silica lens down to a spot on the diamond that is approximately 200 microns x 50 microns. The power in each laser pulse is monitored using a sensor and fed back to the power supply to maintain the desired power level for ablation. The translation stage moves the sample in a raster pattern across the beam, with a step size much smaller than the beam spot in order to ensure as flat as possible a cut surface.

#### 5. HAZARDS PRESENT:

Y/N	Hazard	Comments
N	Open/accessible laser beam.	
Y	Laser operations at eye level (standing or sitting).	Sitting
Y	Ultraviolet radiation/blue light exposure.	
N	Non-beam related reflective surfaces (e.g. computer monitors,	
	etc.) in vicinity of laser/laser beam(s).	
N	Stray beam(s)	
N	Exposed high voltage power supplies.	
N	Exposed capacitors.	
N	Collecting optics (e.g. microscopes, telescopes, etc.)	
N	Fumes/vapors.	
N	Plasma radiation.	
Y	Compressed gases.	Helium, Argon, Fluorine
Y	Hazardous chemicals.	
N	Hazardous waste.	
Y	Fire/Combustible Materials.	
Y	Researcher conducted laser maintenance (routine adjustments	Refill of gas reservoir
	etc. not to include servicing).	
N	Poor housekeeping.	

Other:	

## 6. CONTROLS:

Applicability	Control	Deficiency	Comments
Y/N		Y/N	
Y	Entryway controls established (Engineered or		
	Administrative).		
Y	Control Area designated and appropriately posted.		
Y	Nominal Hazard Zone (NHZ) established.		
Y	Laser master switch (key or computer code). Key		
	removed from laser system when not in use.		
Y	Laser beam enclosure utilized.		
Y	Laser beam enclosure interlocks operational.		
Y	Laser housing cover interlocks operational.		
	Appropriate beam attenuators (stops/dumps) utilized.		
Y	Laser secured to base.		
Y	Laser associated equipment secured to base.		
	Protective barriers (e.g. curtains, partitions).		
Y	UConn Laser Safety Manual available.		
	Alignment Procedure Established		
Y	Emergency off/stop (i.e. panic button) identified.		
Y	Rapid egress and emergency access satisfactory.		
Y	Personal Protective Equipment (PPE)		
N	Non-beam hazards addressed satisfactorily.		

Training requirements completed for all lab personnel.	

## 7. EYEWEAR CRITERIA: (Discard damaged or unfit eyewear!)

Eyewear Criteria	Y/N	Comments
Sufficient pairs available.	Y	
Eyewear specific to laser wavelength(s).	Y	
Optical Density (OD) appropriate for all ranges of	Y	OD 5+ @ 190-375nm
laser energy/power operations.		
Proper fit.	Y	
Free of damage and or excessive scratches.	Y	

## LASER EYEWEAR USE CHART

For this laser:			Wear this eyewear:			
Type of Laser	Wavelength (nm)	Notes	Designation/ Manufacturer	Wavelength attenuated (nm)	Optical Density (OD)	Notes
Class IV	192nm		Trinity Technologies	OD 5+ @ 190 - 375nm		

### 8. OPERATING PROCEDURES:

•	Initial preparation of lab environment and laser for normal laser operation (e.g. key position, interlock activated, outside warning signal on, identification of personnel, operational log, etc.).
•	Alignment procedure:
•	Target area preparation:
On	ce proper alignment is complete, check to ensure that nothing blocks the beam path.
•	Operational procedure (power settings, Q-switched mode, pulse rate, other):
Tur the tog and vol wh	on the key switch to ON. Turn on the main power supply and allow the laser to warm up for ten minutes, firing the laser before warm up timer turns off may destroy the thyratron. Set the "Ext. trigger" push-button to the internal trigger mode. Turn the gle switch below the digital display towards the rep rate knob and rotate until the display reads 2 Hz. Push the "HV ON' button turn the toggle switch below the display towards the "HV Level" knob and turn it all the way counter-clockwise setting the tage to zero. Push the "Laser ON" button and turn the "HV Level" knob clockwise until the display reads the high voltage value ich is given in the test sheet for the particular gas being used (ArF = 24-25kV). The laser will now fire at 2 Hz and can be turned by pressing the "Laser OFF" button located on the HV power supply.
•	Shutdown procedure:
	ss the "Laser OFF" button located on the HV power supply to stop the laser. Then turn off HV by pressing "HV OFF" also ated on the HV power supply. Turn key switch to the off position.
•	Special procedures (e.g. servicing, maintenance, safety tests, interlock bypass, etc.):
	The laser gases must be refreshed which is outlined in the operational manual.

Emergency snutdown procedure			
Press the red "Laser OFF" butto	on located on the HV power s	upply.	
Hazardous waste disposal proce	dures (if applicable):		
No waste will be generated dur	ing the normal operation of t	he laser.	
LABORATORY PERSONNEL L	ISTING:
